3. Optical Communication System .....	26 - 39
4. Data Communication .....	40 - 42
5. Cellular Network .....	43 - 49

# Microwave Communication

**Q1** What is “skip distance”? Why there is better high frequency reception during night time?

A long distance microwave link consists of a chain of repeaters at 40 km intervals. What must be the minimum height of transmitting and receiving antennas above ground level? (The antennas are identical to each other in order to ensure line of sight communication).

**Solution:**

Skip distance can be defined as:

1. The minimum distance from the transmitter at which a sky wave of given frequency is returned to earth by ionospheric layer.
2. The minimum distance from the transmitter to a point where sky wave of a given frequency is received.
3. The minimum distance within which a sky wave of given frequency fails to reflect back.

There is a zone which is not covered by any wave (surface or sky wave) called skip zone.

During night time layer  $F_1$  and  $F_2$  combines and form one layer called  $F$  layer and  $D$ -region vanishes altogether. Thus in night time only two principal layer exists i.e.  $E$  &  $F$  layer.

So there is better high frequency reception during night time.

Distance between repeaters  $d = 40$  km,  
when there is no atmosphere.

$$d(\text{km}) = 3.57[\sqrt{h_t} + \sqrt{h_r}]$$

$$40 = 3.57[2\sqrt{h}] \quad \text{given } [h_t = h_r]$$

where,  $h_t$  = height of transmitter in antenna in meters and  $h_r$  = height of receiving antenna in meter

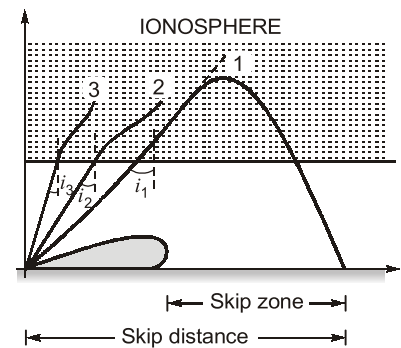

$$h_t = h_r = 31.38 \text{ m}$$

When atmosphere is present,

$$d = 4.12[\sqrt{h_t} + \sqrt{h_r}]$$

$$40 = 4.12[2\sqrt{h}]$$

$$h_t = h_r = 23.56 \text{ m}$$

**Q2** The critical frequencies at an instant observed for  $E$ ,  $F_1$  and  $F_2$  layers were found to be 3, 5 and 9 MHz. Find the corresponding concentration of electrons in these layers.

**Solution:**

**Given:** Critical frequencies for  $E$  layer = 3 MHz, critical frequencies for  $F_1$  layer = 5 MHz, critical frequencies for  $F_2$  layer = 9 MHz.

**To be calculated:** Concentration of electrons.

$$f_c = 9\sqrt{N_{\max}} \quad \Rightarrow N_{\max} = \frac{f_c^2}{81}$$

$$\text{For } E \text{ layer, } f_c = 3 \text{ MHz} \quad \Rightarrow N_{\max} = \frac{f_c^2}{81} = 9 \times \frac{10^{12}}{81} = 0.111 \times 10^{12} \text{ Electrons/m}^3$$

For  $F_1$  layer,  $f_c = 5$  MHz  $\Rightarrow N_{\max} = \frac{f_c^2}{81} = 25 \times \frac{10^{12}}{81} = 0.3086 \times 10^{12}$  Electrons/m<sup>3</sup>

For  $F_2$  layer,  $f_c = 9$  MHz  $\Rightarrow N_{\max} = \frac{f_c^2}{81} = 81 \times \frac{10^{12}}{81} = 10^{12}$  Electrons/m<sup>3</sup>

**Q3** For an ionospheric layer at a height of 300 km, having electron concentration of  $5 \times 10^{11}$  per m<sup>3</sup>. Find the maximum permissible frequency at an angle of incidence of  $60^\circ$ . Calculate the critical frequency and skip distances, under flat earth assumptions.

**Solution:**

Under Flat Earth assumptions we have,

From  $\triangle AOB$ ,

$$\begin{aligned} \cos i &= \frac{BO}{AB} = \frac{h}{\sqrt{h^2 + D^2/4}} \\ &= \frac{2h}{\sqrt{4h^2 + D^2}} \end{aligned}$$

$$\Rightarrow \cos 60^\circ = \frac{2 \times 300}{\sqrt{4 \times (300)^2 + D^2}}$$

$$\Rightarrow 4 \times (300)^2 + D^2 = (1200)^2$$

$$\Rightarrow D^2 = 1080,000$$

$$\Rightarrow D = \text{Propagation distance } AC = 1039.23 \text{ km} = \text{Skip - distance}$$

Also, ionization density (electrons per cubic meter) =  $N_{\max} = 5 \times 10^{11} / \text{m}^3$

$\therefore f_c =$  Critical frequency for the layer

$$= 9\sqrt{N_{\max}} = 9\sqrt{5 \times 10^{11}} = 6,36,3961.03 \text{ Hz} = 6.36 \times 10^6 \text{ Hz} = 6.36 \text{ MHz}$$

Now, maximum permissible frequency under flat earth assumptions is,

$$\begin{aligned} f_{\text{muf}} &= f_c \sqrt{1 + \left(\frac{D}{2h}\right)^2} = 6.36 \times 10^6 \sqrt{1 + \left(\frac{1039.23}{600}\right)^2} = 12.719 \times 10^6 \text{ Hz} \\ &\approx 12.72 \text{ MHz} \end{aligned}$$

**Q4** A high frequency radio link has to be established between two points at a distance of 2500 km on the earth's surface. Considering ionospheric height to be 200 km and its critical frequency 5 MHz, calculate the maximum usable frequency for the given path.

**Solution:**

Given:  $D = 2500$  km,  $h = 200$  km and  $f_c = 5$  MHz

Maximum Usable frequency is,

$$f_{\text{muf}} = f_c \sqrt{1 + \left(\frac{D}{2h}\right)^2}$$

$$\Rightarrow f_{\text{muf}} = 5 \sqrt{1 + \left(\frac{2500}{2 \times 200}\right)^2} = 31.65 \text{ MHz}$$

- Q5** Calculate the skip distance for flat earth with MUF of 10 MHz if the wave is reflected from a height of 300 km where the maximum value of refractive index ( $n$ ) is 0.9.

**Solution:**

Given: MUF = 10 MHz, height ( $h$ ) = 300 km and  $n = 0.9$ .

To be calculated: Skip distance.

$$n^2 = 0.81 = (1 - 81N/f^2)$$

$$N_{\max} = (1 - n^2) f^2 / 81 = [(1 - 0.81) \times 10^{14}] / 81 = (19/81) \times 10^{12}$$

$$= 23.45 \times 10^{10} \text{ Electrons/m}^3$$

$$f_c = 9\sqrt{N_{\max}} = 9\sqrt{(23.45 \times 10^{10})} = 9 \times 4.8425 \times 10^5 = 4.36 \text{ MHz}$$

$$d_{\text{skip}} = 2h\sqrt{[(f_{\text{MUF}}/f_c)^2 - 1]} = 2 \times 300\sqrt{[(10/4.36)^2 - 1]} = 600 \times 2.06$$

$$= 1236 \text{ km}$$

- Q6** Calculate the maximum single hop distance for  $D$ ,  $E$ ,  $F_1$  and  $F_2$  layers if their heights are assumed to be 70, 130, 230 and 350 km respectively above the earth and the angle of incidence is  $10^\circ$  in all cases.

**Solution :**

To be calculated: Skip distance ( $d$ )

$$\cos\theta_i = \frac{OB}{AB}$$

$$\cos\theta_i = \frac{h}{\sqrt{h^2 + d^2/4}} = \frac{2h}{\sqrt{4h^2 + d^2}}$$

$$\cos^2\theta_i = \frac{4h^2}{4h^2 + d^2}$$

$$4h^2(\cos^2\theta_i - 1) = -d^2\cos^2\theta_i$$

$$d^2\cos^2\theta_i = 4h^2(1 - \cos^2\theta_i)$$

$$d^2 = 4h^2(\sec^2\theta_i - 1)$$

$$\boxed{d = 2h\sqrt{(\sec^2\theta_i - 1)}}$$

$$d = 2h\sqrt{(\sec 10^\circ)^2 - 1} = 2h \times 0.176 = 0.352h$$

For  $D$  layer,

$$d = 0.352h = 0.352 \times 70 = 24.64 \text{ km}$$

For  $E$  layer,

$$d = 0.352h = 0.352 \times 130 = 45.76 \text{ km}$$

For  $F_1$  layer,

$$d = 0.352h = 0.352 \times 230 = 80.96 \text{ km}$$

For  $F_2$  layer,

$$d = 0.352h = 0.352 \times 350 = 123.2 \text{ km}$$

- Q7** In a microwave communication link operating at 100 MHz, the respective heights of transmitting and receiving antennas are 49 m and 25 m respectively. If the transmitted power is 100 W, then determine:

- The line of sight (LOS) distance.
- The electric field strength received at LOS distance.

**Solution:**

Operating frequency,  $f = 100 \text{ MHz}$

Transmitted power,  $P_t = 100 \text{ W}$

Height of transmitting antenna,  $h_t = 49 \text{ m}$

Height of receiving antenna,  $h_r = 25 \text{ m}$
